# Industrial Hygiene Services

Keep your employees healthy by proactively managing environmental factors at the workplace.

CCI has experienced, trained technical staff who can inspect, assess, evaluate, sample, and test workplace conditions that may result in workers' injury or illnesses. Whether biological, physical, chemical, or ergonomic, CCI can provide a full range of industrial hygiene services.

In addition to serving employers, CCI also works with homeowners, property owners, property management companies, realtors, developers, schools, insurance carriers, and general contractors.

## Asbestos Testing

Knowing whether there is asbestos present in a home or business is vital to maintaining the safety and health of those in residential, commercial, or construction settings. Asbestos has been used in a wide variety of construction materials for many years and has placed workers in the industry at risk for several occupational illnesses.

## Indoor Air Quality Testing and Monitoring

Poor indoor air quality, moisture intrusion, and chemicals present in the air of buildings and homes can lead to several health-related issues or exacerbate existing ones.

CCI provides comprehensive assessment and testing for a variety of possible pollutants in buildings or homes. One common source of poor indoor air quality is mold. CCI can make sure your environment is safe and healthy from a current mold situation and help you avoid the risks of mold in the future. We'll conduct the investigation and provide a comprehensive report.

## Lead Paint Testing

Lead from paint, including lead-contaminated dust, is the most common cause of lead poisoning. In most structures built before 1978, there is a good chance lead-based paint is present. With the increase in highway work, bridge repair, residential lead abatement, and residential remodeling, the potential for exposure to lead-based paint has become more common.

Employers of construction workers are responsible for implementing a worker protection program that includes meeting certain OSHA standards related to lead. Property managers are also responsible for maintaining residential and commercial buildings free of lead.

CCI provides lead paint testing and analysis, providing the data and expert guidance you need to achieve compliance on every job site or property.

## Radon Testing and Mitigation

Radon is a known human carcinogen that can cause serious health issues for both employees and property owners. This radioactive gas rises through the soil and can enter structures through small cracks and fissures in the foundation.

Employees working in underground or enclosed construction worksites may encounter a high concentration area, running a higher risk of lung cancer. For residential settings, it's vital to check the radon levels before buying a home. Mitigation measures are straightforward and effective.

Since radon is colorless, odorless, and tasteless, the only way to know if it's present is to test. CCI provides professional radon testing services using a variety of different sampling media with a fast turnaround time to assure that workers and property owners are safe from radon exposure.
